

Getting started with the Calculator Example

Below are some brief instructions on how to import and run the RAP Calculator Example, which I currently use in my talks.

Special thanks to all of you who attended my recent talks at the Salem Java User Group ([download the slides](#)) and the Seattle Code Camp.

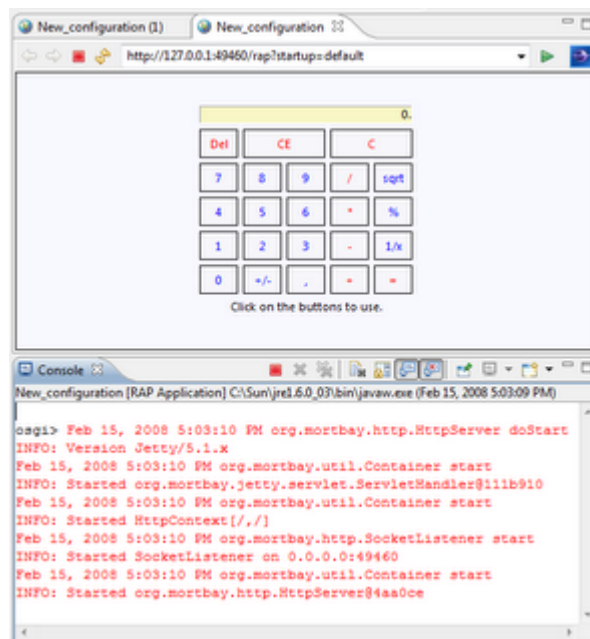

Installation Instructions

Note: the example needs **RAP 1.1 M1 or newer**. It will not work with RAP 1.0.

1. To install RAP and launch a demo application, [visit this screencast](#). Total running time is approx. 3 minutes.
2. To install the Calculator Example [download the file 'calc.ui.rap.zip'](#).
3. [To import the sources from 'calc.ui.rap.zip' follow these instructions](#).

You should now have the 'calc.ui.rap' project in your workspace. If you've compile errors make sure you are using a RAP 1.1 M1 (or newer).

4. To run the calculator you can use the supplied launch configuration:
 - Expand the 'calc.ui.rap' project
 - Select 'Calculator Example.launch'. Right click > Run As > Calculator Example
 - You should see the Calculator-App, similar to the screenshot below.

If you get stuck, please leave a comment.

Have fun with RAP,
Elias.
