

Yoxos SecureSource™ for Eclipse

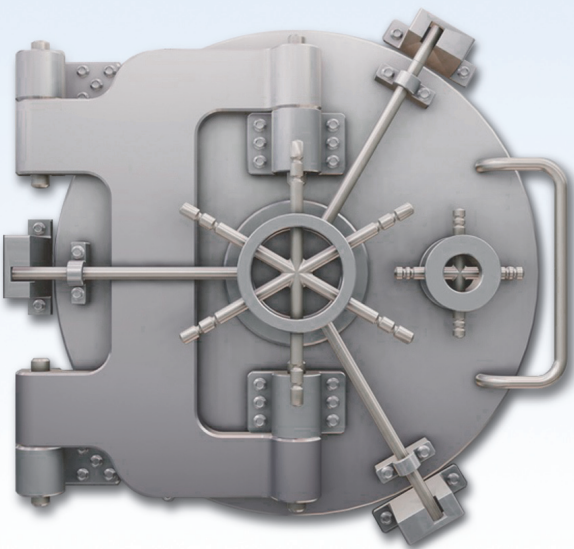

Certified Components from a Trusted Source

Eclipse. Certified.

Today, open source is broadly used by a wide variety of organizations around the globe because it provides real business value, reduces costs and is simple to get. In fact, Eclipse has now been deployed in 70% of all companies with more than 500 employees. The benefit of simple access to open source, however, can come at a price. The origin of specific code is often difficult to validate and the potential exists for the introduction

of unauthorized code changes, security exploits or viruses. These unknowns can threaten the security, integrity and stability of your infrastructure. This is especially true for development environments since they require access to the local file system and include support for browser proxies.

Open Source. Closed Loop.

“The benefit of simple access to open source can come at a price. The potential exists for unauthorized code changes, security exploits or viruses which can threaten the security, integrity and stability of your infrastructure.”

SecureSource takes the worry out of using open source and third party components by validating and certifying them to the specifications you need. SecureSource delivers the freedom to confidently deploy open source components such as Eclipse bundles in your development environment and production systems.

Open Source. Closed Loop.

Close the loop between open source and your business. SecureSource components are guaranteed to be sourced directly from the authoring organization. All SecureSource components are validated in a standards compliant process and signed by EclipseSource to certify authenticity. These bundles are then downloaded to your environment from secure servers to ensure fidelity.

Certified

SecureSource software has been certified by an international quality and safety body. In fact, SecureSource was the first open source repository product to receive certification in functionality and data security.

Analyzed. Validated.

Trust the components you consume and consume components more easily. All SecureSource bundles reside in fully coherent repositories – get everything you need from one place. For additional protection, virus and security exploit scanned bundles are available to meet your most stringent compliance needs.

Process Compliant

Streamline compliance within your organization's procurement and open source consumption and licensing processes. SecureSource components are prepared using fully documented, auditable and reproducible processes.

Standards Compliant. Audit Ready.

The road to standards and regulatory compliance is challenging enough without having to worry about the open source components you use.

SecureSource AuditReady bundles arrive fully tested and certified compliant with some of the most stringent industry protocols and regulations. The only components you will need to validate are your own.

Yoxos SecureSource is available in three different validation levels to match your software and organizational needs.

Yoxos SecureSource – Certified Edition

You don't have time to worry about versions and or to be concerned about the integrity of the open source you are using. SecureSource Certified Edition provides your team with a trusted, one stop shop for the components you need.

Yoxos SecureSource – Trusted Edition

Be confident that your open source bundles are free of malicious code and have well understood licensing.

Yoxos SecureSource – AuditReady Edition

Designed for the most stringent requirements, SecureSource AuditReady bundles have been scanned for security exploits and vulnerabilities. Our preparation of AuditReady bundles adheres to a rigorous, well-documented process that conforms to the most demanding security and privacy regulations.

If your application demands the highest levels of security and source code integrity, consider SecureSource AuditReady as your first and only stop for open source bundles.

Intuitive Subscription-Based Pricing

SecureSource is available on a flexible, cost effective annual subscription basis ensuring your team always has access to the most up-to-date repository of trusted code available.
