

# Seecago: Cross-Platform Home Security Solutions

**Seecago, Inc** ([www.seecago.com](http://www.seecago.com)) is a Florida based IT consulting and development company. Seecago helped many of their customers to upgrade their existing applications to the latest technologies. One of their customers is **Envera Systems**, a company which offers **electronic security solutions to communities**.

Seecago developed all the software components for the Envera Systems electronic security solutions. One of the components is the resident web portal My Envera. The foundation of this web portal is **RAP (the Remote Application Platform)**. At the end of 2013 Envera Systems came with a request to Seecago to create a mobile application for their clients to **register guests with ease**. Residents can now easily access the My Envera application from their phone or tablet.

Seecago has extensive knowledge and experience in building native iOS and Android applications, but it was almost a no-brainer to select Tabris as the platform of choice.

**Tabris integrated seamlessly** with the existing web application. The startup time was close to nothing, and the total implementation time of the application less than a couple of months. The time would have been more than double had Seecago chosen to build the app from scratch.

The dedicated Tabris support team was always there to help Seecago overcome any challenges they might come across.

“Even though seamless integration was key to our decision, the support that is provided for tools like Tabris was equally important. How fast is the help you get when you have a critical issue? Our experience: the Tabris team indeed really helped us fast at very critical moments.”

Vincent Raaijmakers, CEO of Seecago, Inc.
